

ABSTRACT

36       A stack of laminated transparent lenses consists of two  
37       alternating optically clear materials in intimate contact. The  
38       materials are a plastic lens and clear adhesive. The adhesive is  
39       uninterrupted. The lens and the adhesive have refraction mismatch  
40       of less than 0.2. A tab portion is part of each lens acts as an  
41       aid in peeling away the outermost lens after contamination of the  
42       lens layer during racing conditions. The lens stack can be  
43       mounted to the posts on the face shield or laminated directly to  
44       a windshield.
